Regulation of bactericidal activity of rat peritoneal macrophages by lysophosphatidylcholine. The relationship between lipid metabolism and phagocytosis was investigated by analyzing phagocytic activity of rat peritoneal macrophages cultured for 4 hr in the presence of lysophosphatidylcholine (LPC). LPC at concentrations of 0.02-1.0 microM enhanced significantly the phagocytosis of Staphylococcus aureus. The enhancement was completely suppressed by actinomycin D or cycloheximide, suggesting that it is mediated by the expression of a phagocytosis-associated molecule(s). At higher concentrations of LPC (1.0-10.0 microM), the enhancement was partially suppressed by actinomycin D. The phagocytosis of S. aureus was inhibited by actinomycin D.
