Download was added 9 years ago in the Software download category. Sometimes I have the feeling that I don't understand anything from JavaScript, after reading a new article, I feel like I must give up on the language and I go for coffee. How can this be? First of all, there's no "JavaScript", it's JavaScript. It's not some variety of Java, like Java-Script, that was only some poorly documented feature of Netscape Navigator 4. There are at least three different meanings of the word. First there's JavaScript the programming language (the ECMAScript standard) that is used in browsers for client side scripting. Second there's JavaScript the language from the browser developer's point of view (whatever you will think of browser developer's points of view). And finally there's JavaScript as a language from general programming (i.e. language designers and academic) point of view. Now my second point. There's JavaScript, then there's the JavaScript that is in browsers and there's also JavaScript that is part of the DOM API. This latter kind is called ECMAScript 5 or ES5 and it's mostly one-to-one with the ECMAScript 5 standard, which was published a few weeks ago. There's a minority of browser vendors that pretend to be following the standard, but in many cases they're just not that careful. So I won't be voting for the ES5 standard to be considered as the official standard. What I'm voting for is to be strict. ECMAScript 5 shouldn't have any unspelled features. Features should be

completely spelled out and precisely designed. Features should be at worst only partially-defined. The spec should be the complete specification and should be as easy to read as possible. If it isn't easy to read it just because there are too many details, then someone should get fired. f678ea9f9e
